Kotuku is a very fast establishing, nutritious, high yielding large leaved white clover with superior summer growth.

Why *Kotuku*?

White clover is critical for feed value and nitrogen fixation in pastures. It is also a key source of protein and energy for milking and growing stock, particularly in summer. *Kotuku* has excellent seasonal growth, and outperforms all other trialled cultivars over the critical summer period.

High-yielding Kotuku fuels both dairy and red meat finishing systems.

Jumps out of the ground

Kotuku jumps out of the ground quicker than many clovers. That helps it compete with fast-establishing ryegrass, and makes it easier to plan broadleaf weed control in new pasture. Weeds are best treated when small, but new clovers must have 3-4 trifoliate leaves before spraying, so the faster your young plants reach this stage, the better your herbicide results.

High yield

This mixed sward trial included one entry without clover. The effect of clover on nitrogen fixation and yield is clear, with *Kotuku* showing particularly good yield.

Oversowing advantage

Oversowing existing pastures with clover can add more clover to your system. Because it gets going so much faster than other clovers, *Kotuku* competes better with existing pasture and is perfect for oversowing.

Persistence

Kotuku has demonstrated robust persistence for a large leaved cultivar, and has a medium stolon density. This drives summer production in dairy and dry stock finishing systems.
